

DATA SECURITY: ROW LEVEL SECURITY(RLS)

Power BI

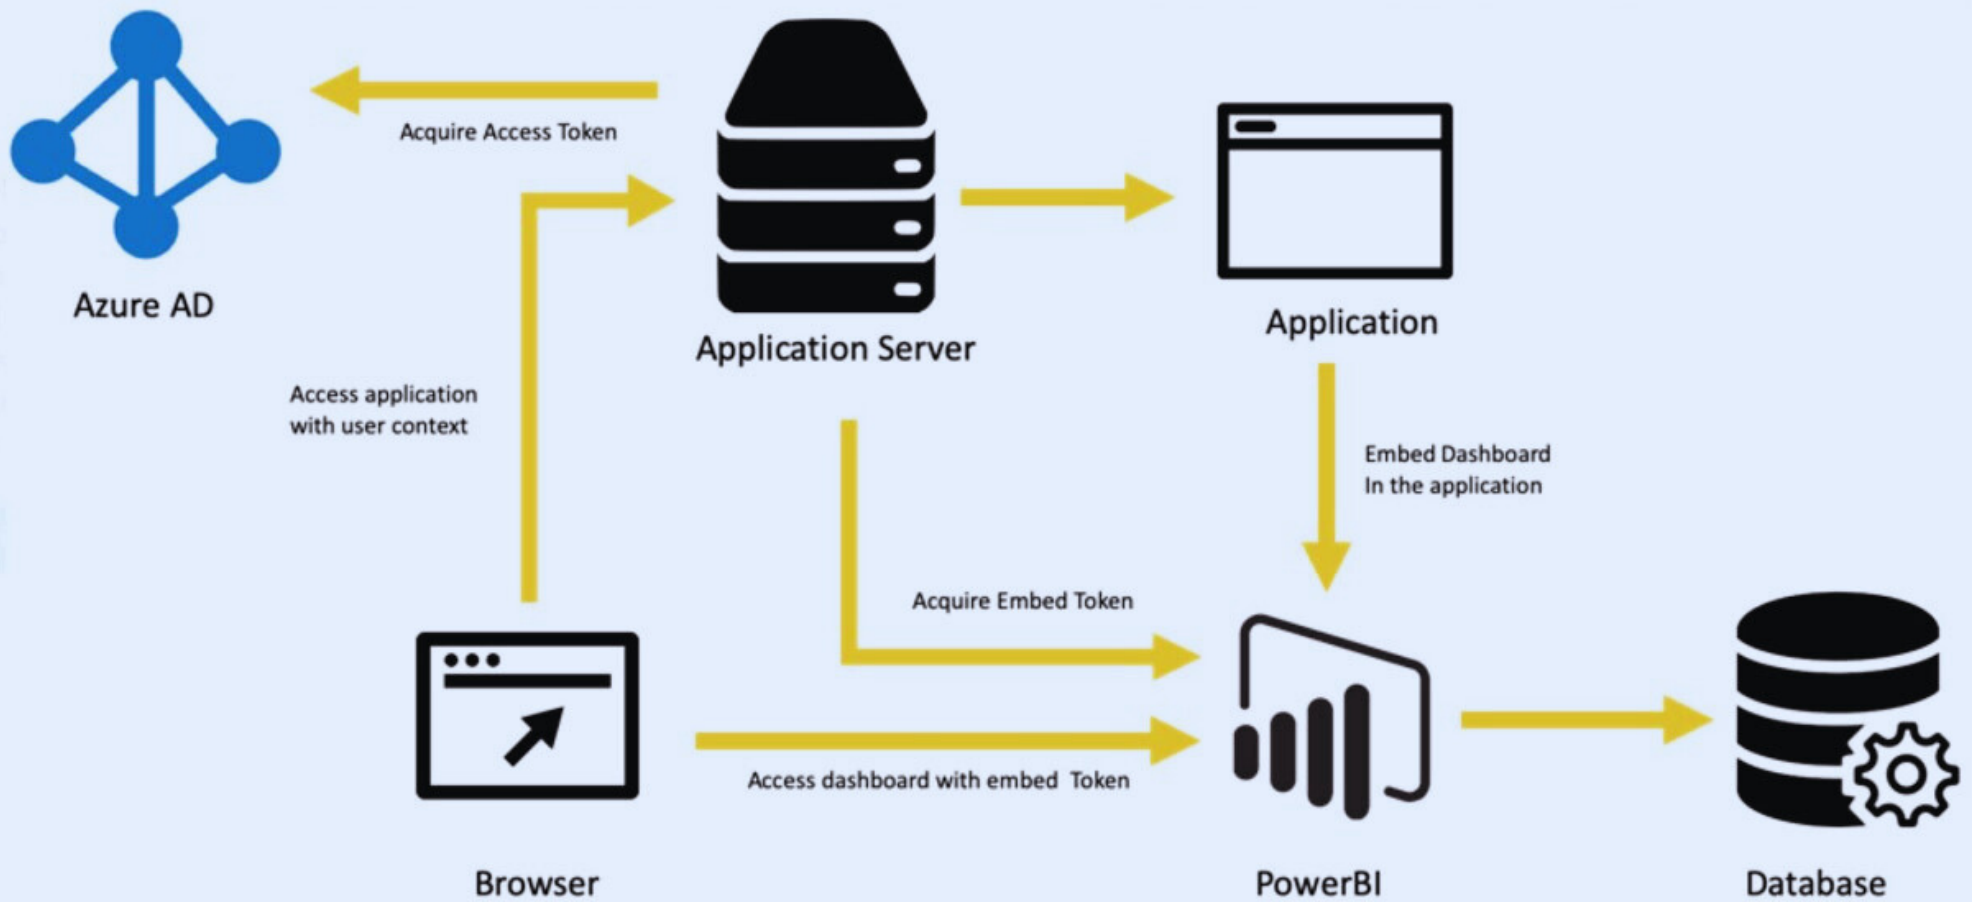

**Archana
Balasubramanian**

ROW-LEVEL SECURITY (RLS)

- RLS restricts access to data at the row level based on defined criteria.
- It ensures users only see authorized data, enforcing security policies and protecting sensitive information.

Architecture diagram showing the integration of Azure AD, Application Server, Application, PowerBI, and Database.

Table filter DAX expression

[Region] = "East"

TYPES OF ROW-LEVEL SECURITY

- Static RLS: Filters based on fixed criteria.
- Dynamic RLS: Filters based on dynamic criteria like user identity.

STATIC RLS

Table filter DAX expression

[Country] = "United States of America"

1. Create Role

2. Select Table to Filter

3. Write a T/F Statement to Filter the Desired Table

Filter the data that this role can see by entering a DAX filter expression that returns a True/False value. For example: [Entity ID] = "Value"

SaveCancel

DYNAMIC RLS

The screenshot displays the Power BI Desktop interface with the 'Manage roles' dialog box open. The dialog box is titled 'Manage roles' and contains three main sections: 'Roles', 'Tables', and 'Table Filter DAX Expression'. The 'Roles' section lists 'Sales Rep' with a 'Create' button (3) and a 'Delete' button. The 'Tables' section lists 'Sales Rep' and 'Transactions', with a filter icon (5) next to 'Sales Rep'. The 'Table Filter DAX Expression' section contains the expression '[Username] = USERNAME()' (6). The 'Modeling' tab (1) is selected in the ribbon, and the 'Manage Roles' button (2) is highlighted in the 'Security' group. The 'Table Filter DAX Expression' section has a '✓' button to confirm the expression.

Dynamic RLS (Row Level Security) is configured in Power BI Desktop. The 'Manage roles' dialog box shows the following configuration:

- Roles:** A role named 'Sales Rep' is defined. A 'Create' button (3) is available to add new roles.
- Tables:** The 'Sales Rep' role is associated with the 'Sales Rep' table. A filter icon (5) is shown next to the table name.
- Table Filter DAX Expression:** The DAX expression '[Username] = USERNAME()' (6) is entered to filter data based on the current user's username.

DIFFERENCE BETWEEN STATIC AND DYNAMIC ROW-LEVEL SECURITY

- Static RLS uses fixed criteria, while dynamic RLS adapts based on user attributes or context.

ROLES AND ROLE-BASED FILTERS

- Roles are defined in Power BI Desktop or the Power BI Service. You can define roles based on user attributes or job functions.
- Role-based filters are created using DAX expressions to specify which rows of data users in each role can access. These filters are applied to tables in the data model.

SECURITY FILTERS

- Security filters are DAX expressions restricting data access.
- In RLS, they define which rows users in each role can access.

PROCESS OF ASSIGNING USERS TO ROLES

- Users are assigned to roles in Power BI Desktop or the Power BI Service.
- Role assignments are managed through the Power BI Service, where users are added to roles and removed as needed.

BEST PRACTICES FOR IMPLEMENTING RLS

- Regularly review and update RLS rules.
- Thoroughly test RLS to ensure correct data access.
- Use dynamic RLS for flexibility.

REPORT PERFORMANCE

- RLS can impact performance, especially for large datasets.
- Optimize by monitoring query execution and refining DAX expressions and data model design.

DATA PRIVACY AND COMPLIANCE

- RLS can impact performance, especially for large datasets.
- Optimize by monitoring query execution and refining DAX expressions and data model design.

TEST AND VALIDATION PROCESS

- Use test accounts representing different user roles.
- Utilize Power BI's View as Role feature to simulate user roles.
